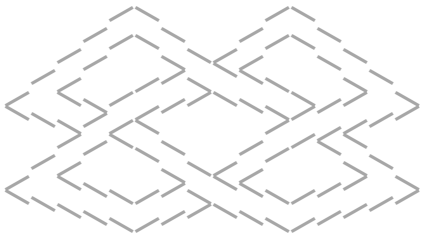
Clean Code

Reference Sheet



01 Understandability

- No magic numbers
- Use **guard clauses**
- **Comment why**, not what
- Keep related code close
- Functions should have **one purpose**
- The **interface should be simpler** than the implementation

02 Maintainability

- Write **descriptive errors**
- **Delete code** aggressively
- Test behavior, not implementation
- Make illegal states unrepresentable
- Tolerate **only three duplications** of code maximum.

03 Scalability

- **Prefer convention** over cleverness
- **Optimize what is critical**, keep abstractions elsewhere
- Choose data structures deliberately
- **Don’t code for functionality that could exist** (but doesn’t)

04 Ease of Modification

- **Organize code by what changes** together
- Refactor in **small steps**
- Keep **detailed tests**
- Isolate volatile code
- Keep **friction** in mind for **future refactors**
